

## **Power BI Multi-Table Data Model — Student Risk & Financial Impact Analysis**

Leadership had no unified view connecting student enrollment status to financial impact — data existed but lived in scattered, disconnected reports with no central source of truth.

Engineered a multi-table relational data model in Power BI — joining inactive student, recent drop, and accounts receivable datasets — applying cross-table filters, DAX calculated fields, and custom visualizations to deliver actionable dashboards that connected student status to accounts receivable trends in a single reporting layer for the first time.
